## Navy-Marine Corps Intranet (NMCI)

The Navy-Marine Corps Intranet (NMCI) is one of the central tenants of Marine Corps network-centric operations. NMCI is being implemented on an enterprise-wide scale through the partnership of the DoN, the DoD, and related defense industries.

NMCI is designed to provide an integrated, garrison-based network for desktop services. The benefits inherent in NMCI include technology updates, interoperable systems, integration of network resources and services, and improved manpower efficiencies. Facilitated by close coordination with corporate technology leaders, NMCI provides contractual support for a vast array of services, including desktop and laptop computers, servers, network infrastructure, applications, help desk services, video teleconferencing, and wireless telephone services. The Marine Corps has obligated $348 million in enterprise orders during FY 2006, while continuing the transition of approximately 89,000 seats to NMCI.

NMCI is designed to improve the ability of the Marine Corps to undertake warfighting missions. By providing a full range of enterprise data, voice, and video services, NMCI is poised to become the garrison-based network the Marine Corps employs for garrison operations in support of expeditionary forces.
